

# Package ‘oceanic’

January 9, 2025

**Type** Package

**Title** Location Identify Tool

**Version** 0.1.8

**Date** 2025-01-09

**Author** shiao chih hao [aut, cre, ctb],  
chang shu ting [aut, ctb],  
wang shyh jiun [aut, ctb]

**Maintainer** shiao chih hao <chihhao@ofdc.org.tw>

**Description** Determine the sea area where the fishing boat operates.

The latitude and longitude of geographic coordinates are used to match oceanic areas and economic sea areas.

You can plot the distribution map with dotplot() function.

Please refer to Flanders Marine Institute (2020) <[doi:10.14284/403](#)>.

**License** GPL (>= 2)

**Depends** R (>= 3.5.0)

**Imports** sf, broom, ggplot2, maps, spData, methods

**Encoding** UTF-8

**RoxygenNote** 7.3.1

**LazyData** true

**Collate** 'idfocean.R' 'idfeeze.R' 'data.R' 'dotplot.R' 'idfland.R'  
'idfcodes.R' 'idfport.R' 'sixtytoten.R'

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2025-01-09 07:30:02 UTC

---

<i>dotplot</i>	<i>dotplot</i>
----------------	----------------

---

**Description**

This function allows you to draw data distribution geographically from a numeric vector.

**Usage**

```
dotplot(
  lona,
  lata,
  map = "ALL",
  grid = FALSE,
  color = "#FF0000",
  size = 1,
  shape = 16
)
```

**Arguments**

lona	Input the longitude.
lata	Input the latitude.
map	default is "ALL", Other possible options is "PAC", "IND" and "ATL".
grid	default is FALSE, when TRUE show the 5 degree grid.
color	default is "#FF0000", define the color of points.
size	default is 1, define the size of points.
shape	default is 16, define the shape of points.

**Value**

the plot of lona and lata.

**Examples**

```
dotplot(141,23)
```

---

eez\_rg

---

*Eez Coefficients*

---

### Description

Predictor feature coefficients as published in paper.

### Usage

`eez_rg`

### Format

`eez_rg` data.frame with 2 variables: `geneName`, `coef`

---

idfcode

---

*idfcode*

---

### Description

This function allows you to convert the location to 4 digital code

### Usage

`idfcode(lon, lat)`

### Arguments

- |                  |                      |
|------------------|----------------------|
| <code>lon</code> | Input the longitude. |
| <code>lat</code> | Input the latitude.  |

### Examples

`idfcode(22, -5)`

**idfeezez***idfeezez***Description**

This function allows you to identify location in which EEZ from a numeric vector.

**Usage**

```
idfeezez(lon, lat, ac = TRUE)
```

**Arguments**

- |     |  |
|-----|--|
| lon | Input the longitude.                           |
| lat | Input the latitude.                            |
| ac  | logical. If TRUE will return full name of EEZ. |

**Examples**

```
idfeezez(141,23)
```

**idfland***idfland***Description**

This function allows you to identify location in which land or ocean.

**Usage**

```
idfland(lon, lat)
```

**Arguments**

- |     |                      |
|-----|----------------------|
| lon | Input the longitude. |
| lat | Input the latitude.  |

**Examples**

```
idfland(22,-5)
```

---

*idfocean**idfocean*

---

**Description**

Return The Pacific Ocean(PAC), Indian Ocean(IND) or Atlantic Ocean(ATL) of your coordinate.

**Usage**

```
idfocean(lon, lat)
```

**Arguments**

lon	Input the longitude.
lat	Input the latitude.

**Value**

the ocean of lon and lat.

**Examples**

```
idfocean(125, 20)
```

---

---

*idfport**idfport*

---

**Description**

This function allows you to identify port name from a numeric vector.

**Usage**

```
idfport(lon, lat)
```

**Arguments**

lon	Input the longitude.
lat	Input the latitude.

**Examples**

```
idfport(121.8006, 25.14065)
```

---

port_sf	<i>port position</i>
---------	----------------------

---

### Description

define the position of port in the world

### Usage

`port_sf`

### Format

`port_sf` data.frame with 2 variables: `row.names`, `id`

---

sixtytoten	<i>sixtytoten</i>
------------	-------------------

---

### Description

This function allows you to transfer the coordinate system from sexagesimal to decimal

### Usage

`sixtytoten(num)`

### Arguments

`num` Input a value of longitude or latitude.

### Examples

`sixtytoten(121.49)`
