

# Package ‘orderstats’

October 14, 2022

**Type** Package

**Title** Efficiently Generates Random Order Statistic Variables

**Version** 0.1.0

**Author** Christian Sims <christian\_j\_sims@yahoo.com>

**Maintainer** Christian Sims <christian\_j\_sims@yahoo.com>

**Description**

All the methods in this package generate a vector of uniform order statistics using a beta distribution and use an inverse cumulative distribution function for some distribution to give a vector of random order statistic variables for some distribution. This is much more efficient than using a loop since it is directly sampling from the order statistic distribution.

**Imports** stats

**License** GPL-2

**LazyData** TRUE

**RoxygenNote** 5.0.1

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2017-06-11 22:09:58 UTC

## R topics documented:

order_probs . . . . .	2

`order_probs`*Gets order statistics from a 0-1 uniform distribution***Description**

Gets order statistics from a 0-1 uniform distribution

**Usage**

```
order_probs(draw_size, k, n)
```

**Arguments**

- |                        |   |
|------------------------|---|
| <code>draw_size</code> | - The size of the output sample                           |
| <code>k</code>         | - The Kth smallest value from a sample                    |
| <code>n</code>         | - The size the sample to compute the order statistic from |

**Value**

A vector of random order statistic variables from a 0-1 uniform distribution

**References**

Gentle, James E. (2009), Computational Statistics, Springer, p. 63, ISBN 9780387981444

`order_rcauchy`*Gets random order statistics from a cauchy distribution***Description**

Gets random order statistics from a cauchy distribution

**Usage**

```
order_rcauchy(draw_size = 1, location = 0, scale = 1, k = 1, n = 1)
```

**Arguments**

- |                        |  |
|------------------------|--|
| <code>draw_size</code> | - The size of the output sample                              |
| <code>location</code>  | - The location parameter in the cauchy distribution          |
| <code>scale</code>     | - The scale parameter in the cauchy distribution             |
| <code>k</code>         | - The Kth smallest value from a sample                       |
| <code>n</code>         | - The size of the sample to compute the order statistic from |

**Value**

A vector of random order statistic variables from a cauchy distribution

**Examples**

```
order_rcauchy(10, 0, 1, 100, 10000)
```

---

order\_rchisq

*Gets random order statistics from a chi-square distribution*

---

**Description**

Gets random order statistics from a chi-square distribution

**Usage**

```
order_rchisq(draw_size, df, k, n)
```

**Arguments**

- |           |  |
|-----------|--|
| draw_size | - The size of the output sample                              |
| df        | - The degrees of the chi-square distribution                 |
| k         | - The Kth smallest value from a sample                       |
| n         | - The size of the sample to compute the order statistic from |

**Value**

A vector of random order statistic variables from a chi-square distribution

**Examples**

```
order_rchisq(10, 1, 100, 10000)
```

**order\_rexp***Gets random order statistics from an exponential distribution***Description**

Gets random order statistics from an exponential distribution

**Usage**

```
order_rexp(draw_size, rate, k, n)
```

**Arguments**

- |                        |  |
|------------------------|--|
| <code>draw_size</code> | - The size of the output sample                              |
| <code>rate</code>      | - The shape parameter in the exponential distribution        |
| <code>k</code>         | - The Kth smallest value from a sample                       |
| <code>n</code>         | - The size of the sample to compute the order statistic from |

**Value**

A vector of random order statistic variables from an exponential distribution

**Examples**

```
order_rexp(10, 0.005, 100, 10000)
```

**order\_rgamma***Gets random order statistics from a gamma distribution***Description**

Gets random order statistics from a gamma distribution

**Usage**

```
order_rgamma(draw_size, shape, scale, k, n)
```

**Arguments**

- |                        |  |
|------------------------|--|
| <code>draw_size</code> | - The size of the output sample                              |
| <code>shape</code>     | - The shape parameter in the gamma distribution              |
| <code>scale</code>     | - The scale parameter in the gamma distribution              |
| <code>k</code>         | - The Kth smallest value from a sample                       |
| <code>n</code>         | - The size of the sample to compute the order statistic from |

**Value**

A vector of random order statistic variables from a gamma distribution

**Examples**

```
order_rgama(10, 20, 2, 100, 10000)
```

---

**order\_rlogis***Gets random order statistics from a logistic distribution*

---

**Description**

Gets random order statistics from a logistic distribution

**Usage**

```
order_rlogis(draw_size, location, scale, k, n)
```

**Arguments**

- |           |  |
|-----------|--|
| draw_size | - The size of the output sample                              |
| location  | - The location parameter in the logistic distribution        |
| scale     | - The scale parameter in the logistic distribution           |
| k         | - The Kth smallest value from a sample                       |
| n         | - The size of the sample to compute the order statistic from |

**Value**

A vector of random order statistic variables from a logistic distribution

**Examples**

```
order_rlogis(10, 0, 1, 100, 10000)
```

---

`order_rnorm`

*Gets random order statistics from a normal distribution*

---

## Description

Gets random order statistics from a normal distribution

## Usage

```
order_rnorm(draw_size = 1, mean = 0, sd = 1, k = 1, n = 1)
```

## Arguments

draw_size	- The size of the output sample
mean	- The mean of the normal distribution
sd	- The standard deviation of the normal distribution
k	- The Kth smallest value from a sample
n	- The size of the sample to compute the order statistic from

## Value

A vector of random order statistic variables from a normal distribution

## Examples

```
order_rnorm(10, 0, 1, 100, 10000)
```
